	A-MCGWG-M-40	
	SUBJECT: MCGWG Meeting, 19 or 20 December 1968	
	TO: COMIREX MC&G Working Group Members	-
	1. An MCGWG Meeting is tentatively scheduled for 19 or 20 December 1968. It is planned that this meeting include requirements, possibly two briefing items by NRO, and other minor items that may be scheduled. The agenda and date will be firmed up by 9 December and each member advised.	25X1 <i>F</i>
	2. In preparation for the 19 or 20 December meeting, the attached information as identified below is forwarded for your review:	
		25X1A
	b. DIA memorandum for file, 78470-68 (less enclosure), dated 3 December 1968, subject: Comments on COMIREX Questions Regarding Need for DISICS on CORONA Missions (enclosure 2). Each member was previously furnished a copy of memorandum of 24 June 1968 as enclosure to our memorandum for MCGWG dated 28 June 1968, subject: Future MCGWG Actions. The last previous discussion on this item is set forth as paragraph 6. in MCGWG-M-38 for the meeting of 24 September 1968.	e 1

HIGH ALTITUDE PHOTOGRAPHY/SPO PHOTOGRAPHY APPLICATION TO 1:250,000-SCALE MAP REVISION PROGRAM

### I. INTRODUCTION

The purpose of this brief study is to compare costs involved in utilizing special classified photography (KH-4 panoramic) versus conventional high altitude photography for revision of 1:250,000-scale maps.

Cost figures are based on a five-year time schedule. High altitude photography costs and annual security maintenance costs are estimated by year in accordance with the preliminary SPO five-year production plan. Nonrecurring costs (article III B1) are amortized over a five-year period for continuity of comparison.

### II. DISCUSSION

### A. Photography Parameters

	High Altitude	KH-4 Pan
Flight height	-	607,000 feet
Format	9" X 9"	5½ X 70-degrees
Negative scale Ground coverage/photograph	<del>-</del>	1:304,000 1600 sq/mi
Estimated negative	(12.2-x 12.2 mi)	(10-x120 mi)
resolution (AWAR)	30 1/mm	120 1/mm

#### B. Theoretical Coverage

Assuming that the high altitude photography is acquired under normal flight design specifications (B/H 0.65,W/H 1.05) and the KH-4 Pan photography is programmed to obtain 100% convergent stereocoverage (10% forward lap, 20% sidelap), the following statements are theoretically valid, as related to the average 1:250,000-scale map (6,600 square statute miles):

## IV. SUMMARY

The foregoing discussions indicate that the application of high altitude photography to the 1:250,000-scale revision program is feasible, but expensive. Even though the high altitude photography would improve present revision techniques, the acquisition cost would be prohibitive as compared with the cost of SPO photography. For a unit map, it is estimated that high altitude photography costs would exceed the total revision costs (salaries, material, etc.) using KH-4 Pan photography. This is based on production figures of 450 man/hours/map.

A conservative conclusive statement is that a secure mapping facility designed to support revision of 100 1:250,000-scale maps per year for five years can be refurbished and maintained in accordance with security requirements for approximately 20% of the cost of procuring high altitude photography.

### Addendum

Thus far, discussions regarding the application of high altitude photography have been limited to the 1:250,000-scale map series. It appears, however, that this photography has distinct application to the standard quadrangle map series.

High altitude photography acquired under controlled conditions would provide an excellent source for interim revision of standard quadrangles. By programming flight lines and exposure intervals so that exposure stations are coincident with the geographic centers of quadrangles, one photograph will cover one quadrangle. Such photography would not be consistent with standard flight design specifications; however, the lens cone angle required to cover one quadrangle would be minimized, reducing relief displacement.

The original negative rectified and enlarged to 1:24,000-scale will provide excellent source data for revision of standard quadrangles. In areas of low relief such a print would, in essence, be a photomap. The tonal contrast would be uniform across the map format, eliminating mosaic or join lines discernible in conventional photomaps.

The availability of a precise rectifying enlarger, such as a Wild E-4, would be required to obtain maximum resolution and geometric conditions in the end product. An unrectified enlargement prepared from a contact print has been produced to demonstrate the feasibility of this concept.

## Approved For Release 2002/09/03 : CIA-RDP79B01709A000500010030-4

Based on the premise that high altitude photography can be procured for it is estimated that rectified and enlarged prints suitable for use as revision source or photomaps can be produced for a total cost of approximately 25X1A

Based on this brief synopsis, it appears that we should pursue a detailed evaluation of the potential application of this photography to the standard quadrangle mapping program.
